The results in this presentation are preliminary materials circulated to stimulate discussion and critical comment. References in publications should be cleared with the authors. This presentation should not be reported as representing the views of the BCL, the OeNB or the Eurosystem. The views expressed are those of the authors and may not be shared by other research staff or policymakers in the BCL, the OeNB or the Eurosystem.

Overview

The majority of homeowners in Luxembourg contributed own labour to acquire their household main residence (HMR)

- approximately 59% of homeowners in Luxembourg
- median contribution of 25,000 euros
- accounting for an average of 19% of their total financial needs44

Own labour contributions (sweat equity)

- can help to get access to credit and homeownership
- mortgage providers in Luxembourg are willing to accept own labour contributions
- are higher when
 - available resources are low
 - interest rate are high
 - households work in the trades

Motivation (1)

- Asymmetric information and adverse selection (Stiglitz and Weiss, 1981)
 - → Limiting access to credit
- Lender's solution: Proof of creditworthiness
 - Show sufficient own (financial) funds
 - Down payment and collateral represent a borrowing constraint (e.g. Engelhardt, 1996; Engelhardt and Mayer, 1998)
 - Evidence of current income (past pay slips)
 - Good past credit history (credit score)
 - Additional guarantees (e.g. life insurance)
- Credit constrained households
 - 5.7% of households indicated that loans were fully / partially turned down
 - 6.2% did not apply for a loan for they feared their application would be rejected

Motivation (2)

- Effect of borrowing constraints on households
 - Save and forego consumption while renting → The more so the higher the down payment requirement and the lower own funds (e.g. Guiso and Jappelli, 2002)
 - Reliance on gifts and transfers from family and friends (e.g. Engelhardt and Mayer, 1998; Guiso and Jappelli, 2002; Benito, 2006)

Down Payment Requirements

- U.S.
 - Historically about 5-20% (e.g. Caplin, et al. 1997; Engelhardt and Mayer, 1998; Jappelli, 2002; Benito, 2006)
 - Reduced to zero in the 2000s (e.g. Kiff and Mills, 2007)
- OECD countries
 - Reduced on average by 7.5 ppt between the 1970s and 1990s (Chiuri and Jappelli, 2003)
 - Particularly relevant for young households
 - Reduction lead to increased homeownership (Andrews et al, 2011)

What about own labour

Sweat equity

We use the term own labour and sweat equity interchangeable and define it as any contribution of a household increasing the value of its residence.

Scarce information available

- 71% of European households paint inside walls themselves (European Home Improvement Monitor, 2017)
- Luxembourg household budget survey in 2014:
 - 33.6% of Luxembourg households performed maintenance and repair works at home
 - The mean value of these contributions was €637.
 - 3.7% of households performed structural and large-scale works (avg. of €1,451)
- Online platforms
 - In Germany, formalized in mortgage applications \rightarrow lenders accept up to 20% of the value
 - Luxembourg?

Survey among mortgage providers

The supply side

Survey among mortgage providers

- Does own labour help households get a mortgage?
- How widespread is it among borrowers?
- Do mortgage providers take it into account? \rightarrow If so, how? To what extent?

Contact main mortgage providing banks in Luxembourg in June 2018

(about 90% of Luxembourg market share)

- Own labour considered only of little relevance for the application and with little if any formalization
- Lenders are typically willing to accept up to 10-15%
- **2014**
 - ~ 2% of applications included own labour contributions
 - \sim 7% \rightarrow conditional average share of own labour in the total investment value
- Applicants likely to contribute own labour \rightarrow low revenue, low own funds, young, craftsmen

The household problem

A theoretical framework

BANQUE CENTRALE DU LUXEMBOURG

Theoretical framework

Imagine a population of nearly identical households that only differ in their available resources

- Available resources *I_i*:
 - initial endowment + present value of lifetime income flow
 - distributed along a continuum between *l* and h
- Homeownership > Renting (ceteris paribus) Henderson and Ioannides (1983)
- Real estate market → only one type of dwelling (H)
- Dwelling acquisition always requires external funding
- Lenders credit rule is common knowledge:
 - level of resources $\geq \alpha$ = minimum level (derived by LTV etc.)
 - considers own labour contributions, s_i

The household problem

Households' problem consists of choosing how much own labour to perform in order to maximize their utility.

- Own labour contributions, S_i :
 - marginal cost $\theta_i \rightarrow$ the same for every household: $\theta_i = \theta$
 - may or may not affect the cost of credit $\rightarrow r(s_i)$ vs r
- Household preferences:

$$u_{i} = I_{i} - c_{r} + b_{i}[H + c_{r} - \theta_{i}s_{i} - r],$$

where $b_{i} = \begin{cases} 1 & \text{if eligible: } resources = I_{i} + s_{i} \\ 0 & \text{otherwise} \end{cases}$

 $\geq \alpha$

Constrained Households

LU Household Finance and Consumption Survey

Descriptive statistics

Data: LU-HFCS

- 2014 wave of the Luxembourg Household Finance and Consumption Survey (LU-HFCS): 1,601 resident households
- Balance sheet information + socio-demographic & -economic variables.
- Specific questions related to the financing of the HMR at the time of acquisition:
 - External funds → mortgages
 - Internal funds → [liquid] wealth (incl. gifts and inheritances)
 - Own labour contributions (sweat equity)
- Main dataset:
 - Subsample of homeowners: 67.6%
 - Corresponding to 1,175 unweighted observations
 - Data are multiply imputed and weighted

Financing sources composition

Source: Own calculations based on the 2nd wave of the LU-HFCS, data are multiply imputed and weighted.

Financing sources composition

Source: Own calculations based on the 2nd wave of the LU-HFCS, data are multiply imputed and weighted.

59% of homeowners contributed to their home with own labour.

Prevalence and amounts of different financing sources

		conditional on HMR ownership				conditional on contribution by source			
	Prevalence	Mean	P25	Median	P 75	Mean	P25	Median	P 75
Own funds	85.8%	127,873	11,700	50,007	160,600	148,990	25,000	75,000	198,000
Own labour	58.9%	33,815	0	4,439	30,000	57,404	9,891	25,000	51,000
External funds	85.8%	166,091	37,518	111,511	269,688	193,516	66,289	141,998	294,736
Sum of financing sources	100.0%	327,780	126,002	255,320	442,301	327,780	126,002	255,320	442,301

Contribution of different financing sources to total financing needs

	conditional on HMR ownership			conditional on contribution by source				
	Mean	P25	Median	P75	Mean	P25	Median	P75
Own funds	35%	10%	27%	52%	41%	16%	33%	59%
Own labour	11%	0%	2%	15%	19%	4%	12%	27%
External funds	53%	30%	57%	80%	62%	43%	66%	83%

Source: Own calculations based on the 2nd wave of the LU-HFCS, data are multiply imputed and weighted.

 Prevalence and contribution of different financing sources to total financing needs by gross income quintiles

Source: Own calculations based on the 2nd wave of the LU-HFCS, data are multiply imputed and weighted. Gross income quintiles of households are constructed based on the sample of HMR owners only.

Prevalence and contribution of own labour decrease with income

 Prevalence and contribution of own labour contributions, by financial funds quintiles used for the acquisition of the HMR

Source: Own calculations based on the 2nd wave of the LU-HFCS, data are multiply imputed and weighted. The sample of HMR owners is grouped into households having contributed with own financial funds and those who have not. Household having contributed with own financial funds are further grouped into quintiles according to their contribution of own financial funds to their total financing needs.

Prevalence and contribution of own labour decrease with own funds

 Prevalence and contribution of different financing sources, by interest rate quintiles

Source: Own calculations based on the 2nd wave of the LU-HFCS, data are multiply imputed and weighted. The annualised agreed rate of lending for house purchase in Luxembourg at the year of acquisition of the HMR is used to construct interest rate quintiles for our sample of HMR owners.

Prevalence and contribution of own labour increase with interest rate

LU Household Finance and Consumption Survey

Conclusion - Does it pay to paint your own walls?

59% of LU homeowners contribute with own labour to finance homeownership helps to get access to credit & homeownership bigger HMR are high if available resources are low interest rate are high households work in the trades

Confirmed by mortgage providers in LU
own labour contributions can influence the decision to offer a mortgage
willing to accept up to 10-15% of total costs
